Description

Technical Field

- 5 **[0001]** The present invention relates to novel biphenyl compounds having GPR 14-antagonizing activity or somatostatin receptor function regulatory activity, or salts thereof, and their use.

Background of the Invention

- 10 **[0002]** Urotensin II was discovered as one of peptide hormones having a potent vasoconstrictive activity, and has been proved to have extremely higher vasoconstrictive activity than endothelin, which is the potentest vasoconstrictor among those which are currently known to have vasoconstrictive activity on mammal arteria. Further, it has been revealed that the receptor for urotensin II is GPR 14 protein, which is one of orphan receptors (see, Nature, vol. 401, p.282 (1999)).

- 15 **[0003]** On the other hand, somatostatin has been isolated and identified from sheep hypothalamus tissue as a factor for strongly suppressing secretion of growth hormone and is a peptide composed of 14 amino acids (SST-14). At present, somatostatin composed of 28 amino acids (SST-28) is also isolated and identified. This somatostatin is a brain-gut peptide widely distributed in not only hypothalamus, but also in brain, limbic system, spinal cord, vagus nerve, autonomic neuroganglion, gastrointestinal mucosa, pancreas Langerhans islets, etc., and suppresses secretion of
20 pituitary-gastrointestinal hormones such as growth hormone, thyroid stimulating hormone, gastrin, insulin, glucagon, etc. Further, it suppresses secretion of gastric juice, pancreatic exocrine and gastrointestinal movement and blood stream. As somatostatin receptors, up to the present, type 1 to type 5 (SSTR1, SSTR2, SSTR3, SSTR4, SSTR5) have been known and it is recognized that each of them shows different expression.

- 30 **[0004]** As compounds having somatostatin receptor regulating activity, there are peptide compounds described in Life Science, 31, 1133-1140 (1982), Nature, 292, 55-58 (1981) and the like; and non peptide compounds described in JP 2000-191615 A, JP 2000-191648 A, JP 2000-226373 A, JP 11-209356 A and the like. As compounds having somatostatin receptor regulating activity and containing biphenyl in their structures, there are compounds described in
35 JP 2000-226373 and the like.

- [0005]** Further, as biphenyl compounds, for example, JP 6-107649 A discloses biphenyl compounds having 5-HT (serotonin) receptor antagonistic activity and its Example 10 discloses 4'-[[[(methoxyacetyl)methylamino]methyl]-N-[4-methoxy-3-(4-methoxy-3-(4-methyl-1-piperazinyl)phenyl)]-2'-methyl-[1,1'-biphenyl]-4-carboxamide hydrochloride.

Summary of the Invention

- [0006]** An antagonist of urotensin II receptor GPR 14 may possibly be developed as a novel vasoactive drug (a therapeutic agent for treating ischemic myocardial infarction, congestive heart failure and the like). However, none of
45 such antagonists have been reported yet.

- [0007]** The present invention provides novel biphenyl compounds having GPR 14-antagonizing activity or somatostatin receptor function regulatory activity, or salts thereof and, based on GPR 14-antagonizing activity, a vasoactive agent, in particular, a vasoconstriction inhibitor which is useful for preventing and/or treating, for example, hypertension, arteriosclerosis, hypercardia, myocardial infarction, heart failure and the like. Further, based on somatostatin receptor
50 function regulatory activity, it provides an agent for preventing and/or treating diabetes, obesity, diabetic complication, intractable diarrhea, glaucoma, acromegaly, depression, tumor and the like.

- [0008]** The present inventors have intensively examined compounds having GPR 14-antagonizing activity or somatostatin receptor function regulatory activity. As a result, it has been found that a compound having the formula (I) below or salts thereof (hereinafter sometimes referred to as "compound (I)") can exhibit an excellent GPR 14-antagonizing
55 activity or somatostatin receptor function regulatory activity. Thus, the present invention has been completed.

[0124] Also, somatostatin associates with, for example, secretion of growth hormones (particularly, SSTR2), and compound (I) can have the same effect or use as that of growth hormone itself when it is used directly or for the purpose of promoting secretion of growth hormone. Therefore, compound (I) can be used for prevention or treatment of diseases or symptoms attributable to the shortage of growth hormone or IGF-1.

[0125] Examples of the "prevention or treatment of diseases or symptoms attributable to the shortage of growth hormone or IGF-1" include treatment of insulin dependent (I type) or independent (II type) diabetes, or a variety of diseases associated with diabetes, i.e., diabetes complications (e.g., diabetic retinitis, diabetic nephrosis, diabetic neuropathy, Dawn syndromes, orthostatic hypotension, etc.); prevention of the catabolic side-effect of glucocorticoid, prevention or treatment of osteoporosis, stimulation of the immune system (increase and enhancement of blood cells such as lymph cells, enhancement of antibacterial action or anti-virus action), promotion of healing of burn or vulnus, acceleration of fracture curing, treatment of acute or chronic kidney diseases, treatment or improvement of diseases or symptoms (short height, growth delay) associated with growth hormone shortage in adulthood or infancy, treatment of obesity, promotion of recovery after surgery, improvement of growth delay associated with Prader-Willi syndromes or Turner syndromes, treatment of intrauterine growth delay or bone formation abnormality, treatment of peripheral nerve diseases, treatment of Noonan syndromes, schizophrenia, ademonia, etc., treatment or prevention of nerve degeneration diseases such as Alzheimer's disease and Parkinson's disease, treatment of lung failure or ventilation dependency disease, treatment of absorption failure syndromes, improvement of cachexia or protein loss due to cancer, AIDS, etc., promotion of weight increase and protein attachment for patient during total parenteral nutrition (TPN), treatment of hyperinsulinism, promotion of ovulation induction, improvement of climacteric disorders, improvement of senile constitution, etc.

Reaction solution included 2.5 μ l of cDNA template, synthetic DNA primers (0.2 μ M each), 0.2 mM dNTPs,
50 1 μ l of Advantage 2 polymerase mix (Clontech) and the buffer appended to the enzyme (total reaction volume of 50 μ l). Thermocycler (Perkin-Elmer Corp.) was used for amplification. The amplification cycle consisted of heating at 95°C for 60 seconds, followed by 5 rounds of 95°C for 30 seconds and 72°C for 3 minutes, 5 rounds of 95°C for 30 seconds and 70°C for 3 minutes, and then 20 rounds of 95°C for 30 seconds and 68°C for 3 minutes, and finally heating at 68°C for 3 minutes. The resultant PCR amplification products were confirmed by purification by electrophoresis on a
55 0.8% agarose gel followed by staining with ethidium bromide.

Reference Example 2: Subcloning of PCR product into plasmid vector and confirming amplified cDNA by reading the nucleotide sequence of cDNA insert

[0143] PCR reaction products obtained in Reference Example 1 were separated on a 0.8% low-melting agarose gel, a gel containing bands was excised using a razor, and DNA was collected using GENECLAN SPIN (BIO 101, Inc.). According to the prescription included in Eukaryotic TOPO™ TA Cloning kit (Invitrogen), the collected DNA was cloned into a plasmid vector for expression in animal cells, pcDNA3.1/V5/His, to construct a plasmid for protein expression, pcDNA3.1-hGPR14 which was then introduced into *Escherichia coli* DH5 α competent cells (Toyobo Co., Ltd.) for transformation. Then, clone which contained cDNA insert fragment was selected on an ampicillin-containing LB agar medium, and separated using a sterilized toothpick to obtain transformant *E. coli* DH5 α /pcDNA3.1-hGPR14. Each clone was cultured overnight on an ampicillin-containing LB medium, and Quiawell 8 Ultra Plasmid kit (Qiagen) was used to prepare plasmid DNA. Portion of DNA prepared was digested with restriction enzyme Sal I, and the size and direction of receptor cDNA fragment inserted were determined. The sequences of nucleotides were determined by using DyeDeoxy Terminator Cycle Sequence Kit (Perkin-Elmer Corp.) and then reading in a fluorescence automatic sequencer. The sequence of clone obtained was analyzed and confirmed to be consistent with a genetic sequence comprising the sequence of human GPR14 gene, of which entire sequence has been reported (EP 0 859 052 A1), and Sal I and Spe I recognition sequences added to the 5'- and 3'-termini of the sequence, respectively (SEQ ID NOS: 3 and 4). It should be noted that although the 1133rd base in the sequence of human GPR14 gene (SEQ ID NO: 3) was identified as C in the report (EP 0 859 052 A1) while it was identified as G in the present Example though the amino acids which would be translated from these sequences may be the same.

Reference Example 3: Preparing human GPR14-expressing CHO cell

[0144] After the transformant *E. coli* DH5 α /pcDNA3.1-hGPR14 prepared in Reference Example 2 was cultured, plasmid DNA for pcDNA3.1-hGPR14 was prepared by using Plasmid Midi Kit (Qiagen). The plasmid DNA was introduced into CHO dhfr cells using CellPfect Transfection Kit (Amersham Pharmacia Biotech) according to the protocol appended thereto. 10 μ g of DNA was co-precipitated with calcium phosphate to prepare a suspension which was then added to a 10 cm petri dish on which 5×10^5 or 1×10^6 CHO dhfr cells had previously been inoculated 24 hours before then. Cells were cultured in a MEM α medium containing 10% fetal bovine serum for one day, subcultured, and cultured in a selection medium, a MEM α medium containing 0.4 mg/ml G418 (GIBCO BRL) and 10% dialysis fetal bovine serum. Colonies of transformed cells (CHO/hGPR14), which were human GPR14-expressing CHO cells growing in the selection medium, were selected.

Experimental Example 1: Preparing human GPR14-expressing cell fraction

[0145] To 1×10^8 CHO/GPR14 cells were added 10 ml of homogenate buffer (10 mM NaHCO₃, 5 mM EDTA, 0.5 mM PMSF, 1 μ g/ml pepstatin, 4 μ g/ml E64, 20 μ g/ml leupeptin), and disrupted using Polytron (12,000 rpm, 1 minute). Cell debris solution was centrifuged at 1,000 g for 15 minutes to obtain a supernatant. The supernatant was then ultrasonicated (in Beckman type 30 rotor, 30,000 rpm, 1 hour), and the resultant precipitant was collected as human GPR14-expressing CHO cell fraction.

Experimental Example 2: Preparing isotope-labeled human urotensin II

[0146] Isotope-labeled human urotensin II to be used in experiments for testing inhibition of binding was prepared as described below. 5 μ g of human urotensin II (available from Peptide Institute, Inc.) was dissolved in 25 μ l of 0.4 M sodium acetate (pH 5.6). To the solution was added 200 ng of lactoperoxidase (Wako Pure Chemical Industries, Ltd.) followed by 1 mCi [¹²⁵I]-sodium iodide (Amersham Pharmacia Biotech) and 200 ng of hydrogen peroxide (10 μ l). The solution was left to stand at room temperature for 10 minutes, another 200 ng of hydrogen peroxide (10 μ l) was added thereto and then the solution was left to stand for 10 minutes. The mixture was then purified by HPLC using TSKgel ODS-80T_S column (4.6 mm x 25 cm, Toso Co., Ltd.) to obtain [¹²⁵I]-labeled human urotensin II.

Experimental Example 3: Experiment for testing the ability of test compound to inhibit binding of urotensin II to GPR14 using human GPR14-expressing cell fraction and isotope-labeled urotensin II

[0147] Human GPR14-expressing CHO cell fraction was diluted in a membrane diluting buffer (20 mM phosphate buffer (pH 7.3), 150 mM NaCl, 5 mM MgCl₂, 0.1% BSA, 0.05% CHAPS, 0.5 mM PMSF, 0.1 μ g/ml Pepstatin, 20 μ g/ml Leupeptin, 4 μ g/ml E-64) to prepare a solution of cell membrane fraction (protein concentration: 3 μ g/ml) for assay. The membrane fraction solution for assay was dispensed in 96-well microplates (85 μ l each) which were left for stand

for reaction at 25°C for 3 hours after adding: 10 µl of membrane diluting buffer containing 1 nM [¹²⁵I]-labeled human urotensin II and 5 µl of di-methylsulfoxide diluted 5-times (by volume) in membrane diluting buffer for examining the total binding; 10 µl of membrane diluting buffer containing 1 nM [¹²⁵I]-labeled human urotensin II and 5 µl of 20% dimethylsulfoxide-containing membrane diluting buffer containing 20 µM human urotensin II without isotope-labeling for examining non-specific binding; and 5 µl of a solution of test compound in di-methylsulfoxide diluted 5-times (by volume) in membrane diluting buffer and 10 µl of membrane diluting solution containing 1 nM [¹²⁵I]-labeled-human urotensin II for testing the ability of test compounds to inhibit binding. The mixture solution was filtrated through a filter plate (GF/C, Watman). Next, the filter was washed three times with membrane diluting buffer (0.2 ml), added with 20 µl of Microscinti 20 (Packard), and determined for radioactivity in Topcount (Packard). Specific-binding is calculated by subtracting non-specific binding from the total binding. The ability of test compound to inhibit binding of urotensin II to human GPR14 is represented by the ratio of [(total binding) - (the radio activity of the cell fraction to which test compound was added)] vs [specific binding]. Concentrations of test compounds at which the compounds showed 50% inhibition of human GPR14 binding activity are shown.

[0148] Results are shown in Table 1.

Table 1

Experimental Example 4: Change in calcium concentration in human GPR14-expressing CHO cell caused by test compound

[0149] GPR14-expressing CHO cells were inoculated on a 96-well plate at 1×10^4 cell/well, cultured for 48 hours, and then washed with 0.1 ml of HBSS containing 20 mM HEPES(pH 7.4), 1% FCS and 1% penicillin-streptomycin (hereinafter referred to as "wash buffer"). Next, 100 µl of another wash buffer containing 4 µM Fluo3, 0.04% pluronic acid and 2.5 mM probenidol (hereinafter referred to as "reaction buffer") was added thereto for reaction at 37°C for 1 hour. The reaction buffer was then removed and the plate was washed three times with 0.2ml of wash buffer. Then, 90 µl of wash buffer and 10 µl of a solution of test compound in dimethylsulfoxide diluted 10 times (by volume) in membrane diluting buffer were added for agonist activity assay, while, for antagonist activity assay, furthermore 10 µl of 10 nM urotensin II was additionally added to determine change in intracellular calcium concentration in FLIPR (Japan Molecular Device). The test compound (compound of Example 71) inhibited urotensin II-induced increase in intracellular calcium concentration.

The solvent was removed by filtration, and the resultant resin was washed with THF, a mixed solvent of THF-acetic acid (1 : 1), THF and methanol in this order and then dried at 50°C under reduced pressure, to give the title compound (19.5 g). The resultant resin (5 beads) was treated with trifluoroacetic acid-dichloromethane (1 : 1, 50 ml) to give 3'-[[[(4-hydroxyphenethyl)amino]methyl][1,1'-biphenyl]-3-carboxylic acid which was then analyzed in HPLC and measured by mass spectrometry.

1) 4-[3-[1-(3-Bromobenzoyl)-4-piperidiny]propyl]-1-piperidine carboxylic acid Wang resin ester

35 **[0349]** A mixture of 4-nitrophenoxy carbonyl Wang resin (6.00 g), (3-bromophenyl){4-[3-(4-piperidiny)propyl]-1-piperidiny]methanone hydrochloride (4.66 g), DIEA (3.76 ml) and DMF (50 ml) was stirred at room temperature for 20 hours. The solvent was removed by filtration, and the resultant resin was washed with DMF, THF and methanol in this order and then dried at 50°C under reduced pressure to give the title compound (6.95 g). The amount of the compound carried on the resin was 0.72 mmol/g (elemental analysis: calculated from 5.77 % Br). The resultant resin (5 beads)

[0526] Hereinafter, the pharmaceutical activity of the compounds of the present invention is specifically illustrated, but is not limited thereto. The gene manipulation procedures using *Escherichia coli* were carried out according to the methods described in the Molecular Cloning, 1989 edition (Molecular Cloning, T. Maniatis et al.).

Reference Example 4

Cloning of human somatostatin receptor protein subtype 5 (SSTR5) DNA

[0527] On the basis of a known nucleotide sequence of human SSTR5 cDNA [Biochem. Biophys. Res. Commun., 195: 844-852, 1993], DNA oligomers, S5-1 and S5-2 were synthesized. The sequence of S5-1 is 5'-GGTCGACCAC-CATGGAGCCCCTGTTCCC-3' (SEQ ID NO:5) and the sequence of S5-2 was 5'-CCGTCGACACTCTCACAGCTTGCT-GG-3' (SEQ ID NO:6). As a template, human chromosomal DNA (Catalog No. CL6550-1, Clontech) was used. 25 pmol of Each of the above DNA oligomers was added to 0.5 ng of the template DNA and subjected to polymerase chain reaction with 2.5 U of Pfu DNA polymerase (Stratagene). The composition of the reaction mixture followed instructions attached to the Pfu DNA polymerase. In the reaction, 35 cycles each consisting of heating at 94°C for 1 minute, at 66°C for 1 minute and at 75°C for 2 minutes were carried out. Electrophoresis of the reaction mixture on 1 % agarose gel indicated that a DNA fragment of intended size (about 1.1 kb) was specifically amplified. This DNA fragment was recovered in a usual manner from the agarose gel, then ligated to pUC118 previously cleaved at its Hinc II site, and transformed into competent cells, *Escherichia coli* JM109. A transformant having a plasmid containing the DNA frag-

ment was selected, and the nucleotide sequence of the insert DNA fragment, confirmed by an automatic nucleotide sequencer ALF DNA sequencer (Pharmacia) using a fluorescent coloring matter, indicated that an amino acid sequence deduced from the nucleotide sequence agreed completely with a sequence described in the literature supra.

5 Reference Example 5

Construction of human somatostatin receptor protein subtype 5 (SSTR5) DNA expression plasmid

[0528] As an expression vector in CHO (Chinese hamster ovary) cells, pAKKO-111 was used. pAKKO-111 was constructed in the following manner. pTB1417 described in JP 5-076385 A was treated with Hind III and Cla I to give a 1.4 kb DNA fragment containing an SR α promoter and a polyA-added signal. Separately, pTB348 (Biochem. Biophys. Res. Commun., 128: 256-264, 1985) was treated with Cla I and Sal I, to give a 4.5 kb DNA fragment containing a dihydrofolate reductase (DHFR) gene. These DNA fragments were blunt-ended by treatment with T4 polymerase and then ligated to each other by treatment with T4 ligase, to construct pAKKO-111 plasmid. 5 μ g of Plasmid having the human SSTR5 DNA fragment obtained in Reference Example 4 was digested with a restriction enzyme Sal I and then subjected to 1 % agarose gel electrophoresis, and a 1.1 kb DNA fragment encoding human SSTR5 was recovered. Then, 1 μ g of the expression vector pAKKO-111 (5.5 kb) was digested with Sal I, to prepare a cloning site for the inserting human SSTR5 DNA fragment into it. This expression vector fragment and the 1.1 kb DNA fragment were ligated to each other with T4 DNA ligase, and the reaction mixture was introduced into *E. coli* JM109 by calcium chloride method, and an expression plasmid pA-1-11-SSTR5 having the human SSTR5 DNA fragment inserted in the normal direction into the promoter was obtained from the resultant transformant.

Reference Example 6

25 Introduction of human somatostatin receptor protein subtype 5 (SSTR5) DNA into CHO (dhfr⁻) cells and expression of the DNA

[0529] 1×10^6 CHO (dhfr⁻) cells were cultured for 24 hours in HAM F12 medium containing 10 % fetal bovine serum in a Petri dish of 8 cm in diameter, and 10 μ g of the human SSTR5 cDNA expression plasmid pA-1-11-SSTR5 obtained in Reference Example 5 was introduced into the cells by phosphate calcium method. 24 Hours after this introduction, the medium was exchanged with a DMEM medium containing 10 % dialyzed fetal bovine serum, and colony-forming cells in the medium (that is, DHFR⁺ cells) were selected. A single cell obtained by limiting dilution from the selected cells was cloned and measured for the ability to express a somatostatin receptor protein in the following manner. The human SSTR5 cDNA-expressing cell strain was diluted with a measurement buffer [50 mM Tris-HCl buffer (pH 7.5) containing 1 mM EDTA, 5 mM magnesium chloride, 0.1 % BSA, 0.2 mg/ml bacitracin, 10 μ g/ml leupeptin, 1 μ g/ml pepstatin, 200 units/ml aprotinin], to prepare a cell suspension containing 2×10^4 cells/200 μ l. In to a tube, 200 μ l of the cell suspension was pipetted, and 2 μ l of 5 nM [125 I]-somatostatin (2000 Ci/mmol, Amersham) was added thereto and incubated at 25°C for 60 minutes. To measure nonspecific binding (NSB), a tube containing 2 μ l (10^{-4} M) of somatostatin-14 was also incubated. 1.5 ml of Washing buffer [50 mM Tris-HCl buffer (pH 7.5) containing 1 mM EDTA, 5 mM magnesium chloride] was added to the sample which was then filtered with a GF/F glass fiber filter paper (Whatman) and then washed with the same buffer. [125 I] of the filter paper was measured by a γ -counter. SSTR5-32-4 was selected as a cell strain having a higher somatostatin binding activity.

Experimental Example 5

45 Preparation of CHO cell membrane fraction containing human somatostatin receptor protein subtype 5 (SSTR5)

[0530] The human somatostatin receptor protein subtype 5-expressing CHO cell strain, SSTR5-32-4 (10^9 cells), were suspended in phosphate-buffered physiological saline containing 5 mM EDTA (PBS-EDTA) and centrifuged. To the cell pellet, 10 ml of homogenate buffer (10 mM NaHCO₃, 5 mM EDTA, pH 7.5) was added, which was then homogenated with a polytron homogenizer. The homogenate was centrifuged at $400 \times g$ for 15 minutes, and the resultant supernatant was further centrifuged at $100,000 \times g$ for 1 hour, to give precipitates of the membrane fraction. The precipitates were suspended in 2 ml of assay buffer [25 mM Tris-HCl buffer (pH 7.5) containing 1 mM EDTA, 0.1 % BSA (bovine serum albumin), 0.25 mM PMSF, 1 μ g/ml pepstatin, 20 μ g/ml leupeptin, 10 μ g/ml phosphoramidon] and centrifuged at $100,000 \times g$ for 1 hour. The membrane fraction recovered as precipitates was suspended again in 20 ml of assay buffer, pipetted, stored at -80°C and thawed just before use.

Experimental Example 6

Measurement of the degree of inhibition of binding to [¹²⁵I]-somatostatin

- 5 **[0531]** The SSTR5-expressing CHO cell membrane fraction prepared in Example 5 was diluted with the assay buffer to prepare a solution at a concentration of 3 µg/ml and pipetted into tubes (173 µl/tube). Two µl of compound dissolved in DMSO and 25 µl of 200 pM [¹²⁵I]-somatostatin (Amersham) were added simultaneously thereto. To measure the maximum binding, a reaction mixture containing 2 µl of DMSO and 25 µl of 200 pM [¹²⁵I]-somatostatin was prepared. To measure nonspecific binding, a reaction mixture containing 2 µl of 100 µM somatostatin in DMSO and 25 µl of 200 pM [¹²⁵I]-somatostatin was also simultaneously prepared. Each reaction mixture was reacted at 25°C for 60 minutes and then filtered under suction with a polyethylene imine-treated Whatman glass filter (GF/B). After filtration, the radioactivity of [¹²⁵I]-somatostatin remaining on the glass filter was measured with a γ counter.

- 10 **[0532]** The degree of inhibition of binding (%) by each test substance was determined according to the following equation:

15

$$\begin{aligned} &\text{The degree of inhibition of binding (\%)} = (\text{radioactivity} \\ &\text{when the compound was added} - \text{radioactivity when DMSO} \\ &\text{solution was added}) / (\text{radioactivity when somatostatin was} \\ &\text{added} - \text{radioactivity when DMSO solution was added}) \times 100. \end{aligned}$$

- 20 **[0533]** While the concentration of the test substance was changed, the concentration of the test substance at which 50% binding was inhibited (IC₅₀ value) was calculated from Hill plots.

- [0534]** The results are shown below:

30

Test Compound	IC ₅₀
Example 325	6 nM
Example 328	3 nM

INTERNATIONAL SEARCH REPORT

International application No.

PCT/JP01/05541

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 31-32
because they relate to subject matter not required to be searched by this Authority, namely:
Claims 31 and 32 pertain to methods for treatment of the human body by therapy and thus relate to a subject matter which this International Searching Authority is not required, under the provisions of Article 17(2) (a) (i) of the PCT and Rule 39.1(iv) of the Regulations under the PCT, to search.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
